

Your photos, notes and reports.

User guide • English • 7 October 2026

On iPhone and iPad, take or import a photo, add visual annotations and descriptions, then share a PDF report.

Get started in 5 steps

1. Open PixoraNote and choose a subscription. A 7-day trial is available to eligible users.
2. Take a photo or use the selection icon at the top left.
3. Add annotations and a description.
4. Tap Save to keep an annotated copy in Photos.
5. Select your saved copies, open Gallery and tap PDF.

Guide overview: [get started p. 1](#) • [annotate p. 2](#) • [export p. 3](#) • [settings p. 4](#) • [subscriptions and help p. 5](#).

Screenshots show the actual app. Some screens use French labels. Layout and labels may vary with the device and language.

Annotate and save

1. Choose an image

On the home screen, tap Take a photo. The Photo button lets you capture another image. The top-left icon (Select photo) opens your photo library. Select one or more images and confirm. In Gallery, tap a thumbnail to annotate it.

2. Use the tools

The bottom toolbar offers a pencil for freehand drawing, a line, circle, arrow, measurement arrow and Aa for text. Drag to draw lines and shapes. Tap with the text tool to enter a label. For a measurement, enter the value and unit yourself: the photo does not automatically measure a real-world distance.

3. Adjust and describe

The sliders icon opens Drawing options: line colour and width, text and background colours, opacity, font size and style. The curved arrows undo and redo supported actions. The trash icon clears annotations. Tap Description to enter the note associated with the photo.

4. Keep the result

Tap Save and wait for confirmation that the image was saved to Photos. Allow access to add photos if iOS asks. The copy contains annotations and any information enabled in settings. Save before selecting another photo: current drawings are reset when the image changes. A saved copy is a flattened image; its annotations cannot be edited again as separate objects.

Tip: keep the original and an annotated copy. For your report, select the copy that already includes your annotations.

Create a PDF report

Select, check, export

1. Use the top-left icon to select the report photos from your library.
2. Confirm: Gallery displays thumbnails and a description for each image.
3. Review each description. The red cross removes an image from the report selection; it does not delete the original from Photos.
4. Open the Gallery gear icon to configure the export, then tap OK.
5. Tap PDF. In the iOS share sheet, choose Save to Files or the receiving app.
6. Open the saved PDF and check every page before sending it.

Choose the layout

Export settings let you choose the page format, margins, photos per page, a cover and page numbering. Enable only the fields you need: project, company, reference, description, date, coordinates or other available information. Start with moderate margins and short descriptions.

Include annotations in the report

The report uses images selected in Gallery. To include your drawings, select the annotated copies saved with Save, rather than unannotated originals. Avoid applying the same information twice to a copy that already contains it.

The DOC option

The DOC button provides an alternative export based on an HTML document. Its appearance depends on the app used to open it. For a consistent document to send to a client, prefer PDF and check the final file.

Settings and location

Photo information

The gear icon on the main screen opens photo settings. Enter the project, company and a reference, then enable the information you want to display. Depending on the field, Photo, Export or Both controls where it appears. Watermark settings control its position and readability.

Date, GPS, altitude and direction

Allow location access in iOS settings if you want to use this information. The app offers coordinate formats and options for altitude, direction and azimuth. Available values depend on your device, permissions and the photo.

Check their source: some information comes from the selected photo, while other fields may use the current location, heading or time. Do not automatically treat values shown for an older photo as its original capture data.

Map inset: Apple Maps or Google Maps

Apple Maps is the default provider. Maps and address lookup may require Internet. Optional Google Maps requires your own Google Maps Static API key; installing the Google Maps app is not enough. Without a valid key, or if the request fails, the app attempts to use Apple Maps. Google service terms and any fees are separate from your PixoraNote subscription.

Data and privacy

Photos, notes and reports are processed locally, without being sent to a Fluc Consulting server. The Google option sends map coordinates, the key and request parameters; Google also receives the IP address. It does not send your photos or reports. Map services and sharing apps apply their own privacy policies. Export anything you want to keep before deleting the app.

Subscriptions and support

Access to features

The app is free to download. All features require an active subscription. Reference prices in France are €4.99 per month or €39.99 per year, with the same features. A 7-day trial is offered to users eligible under Apple's rules. After the trial, the subscription becomes paid and renews automatically unless cancelled. The price and offer shown by Apple before confirmation apply and may vary by country.

Restore or cancel

Use Restore Purchases on the subscription screen if your purchase is not recognised, using the same Apple Account as the original purchase. To manage or cancel: iOS Settings → your name → Subscriptions → PixoraNote. Check the date shown by Apple. Deleting the app does not cancel a subscription. Without active access, features are locked; purchase restoration remains available.

Common issues

Cannot save: check Photos permission and available storage.

Missing photo: check which photos the app can access in iOS settings.

Annotations missing from PDF: save first, then select the annotated copy.

Export fails: select at least one image, reduce margins or caption size and try again.

No map or location: check Internet and location access; try Apple Maps.

Subscription not recognised: check your Apple Account and connection, then restore purchases.
